

# Touchscreens, keyboards & Co: Simply eliminate the risk of infection

## What is the problem?

Up to **98%** of hospital staff use mobile phones at work [1]

## Why is that relevant?

- Up to 99 % of smartphones are contaminated with bacteria [2,3]
- *Staphylococcus aureus* can be found on up to 32.4 % of smartphones, one third of which are methicillin-resistant *S. aureus* (MRSA) [3]
- 38.5 % of all mobile phones are contaminated with viruses [4]
- Only 10-46 % clean the device daily [2,3]

## And what about keyboards?

- Up to 96.7 % of computer keyboards in the healthcare sector are microbially contaminated [5]
- MRSA can be found in up to 72 % of samples, vancomycin-resistant enterococci (VRE) in 31 % and multidrug-resistant *Acinetobacter spp.* in 17 % [6]

## This is the solution:

- Ensure regular disinfection of your mobile communication devices.
- Use low-alcohol wipes (e.g. Bacillo® 30 Sensitive Tissues\*) that are gentle on materials to remove viruses as well as bacteria and yeasts from sensitive surfaces [7].

\* Patented formulation for disinfecting sensitive surfaces such as smartphones and tablet computers.

Use surface disinfectants safely. Always read the label and product information before use.
